NORMALIZATION AND DATABASE DESIGN

A. Database Model representing Nora's Bagel Bin:

1.

a. **Second Normal Form (2NF)**

b.

BAGEL ORDER	
PK	Bagel Order ID
	Order Date
	First Name
	Last Name
	Address 1
	Address 2
	City
	State
	Zip
	Mobile Phone
	Delivery Fee
	Special Notes

1: M

BAGEL ORDER LINE ITEM	
PK / FK	Bagel Order ID
PK / FK	Bagel ID
	Bagel Quantity

M: 1

BAGEL	
PK	Bagel ID
	Bagel Name
	Bagel Description
	Bagel Price

(cont'd)

b. **Description (Cardinality):**

Bagel orders can have only one and only one bagel order line items, while bagel order line items may have many bagel orders. Similarly, bagels can have only one and only one bagel order line items, while a bagel order line item can have many bagels.

c. **Explanation of a and b:**

In order to normalize the database to second normal form, it would already have to be in first normal form. In addition to this, for the database to be in second normal form, we would also need to remove all partial dependencies. Which means that non-key attributes should be fully dependent on the candidate key.

(cont'd)

Jarone McCorkle
C170: Data Management – Applications (MySQL)

Nora's Bagel Bin Database Blueprints

First Normal Form (1NF)

BAGEL ORDER	
PK	Bagel Order ID
PK	Bagel ID
	Order Date
	First Name
	Last Name
	Address 1
	Address 2
	City
	State
	Zip
	Mobile Phone
	Delivery Fee
	Bagel Name
	Bagel Description
	Bagel Price
	Bagel Quantity
	Special Notes

Figure 1

This will make more sense if we reference figure 1, which is our database in first normal form. Looking at figure one, we have non-key attributes that are not fully dependent on both candidate keys: Bagel Order ID, and Bagel ID. These attributes need to be separated to their own tables so that all non-key attributes are fully dependent on the candidate key within their respective tables.

Therefore, figure one, the Bagel Order table, can be broken down into two additional tables; Bagel Order Line Form, and Bagel. Now the tables are each narrowed down to a single purpose; For example, the Bagel table has all attributes related to, you guessed it, a bagel. With the bagel name, description, price per bagel, and a bagel ID set as the primary key to differentiate each bagel from one another. We can clearly see that attributes not related to a bagel, would not be in this table. This is what we mean by single purpose.

Lastly, the relationships between the entities are such that for every one bagel order, there can be many line items, and each line item has a description of a bagel.

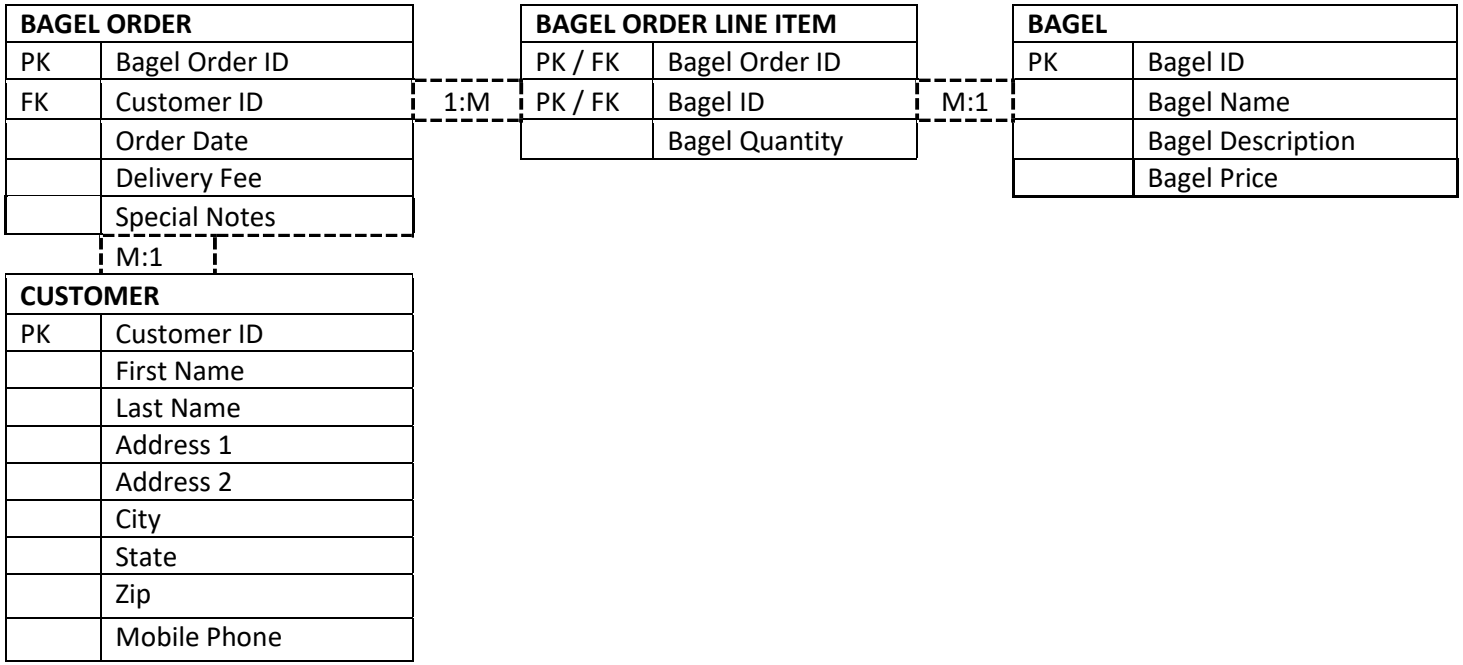
(cont'd)

2. **Database Normalized to third normal form**

Nora's Bagel Bin Database Blueprints

Third Normal Form (3NF)

a. **Attribute assignment b. Table names and c. Foreign keys used to link each table:**



d. **Description (Cardinality):**

Each customer can have many bagel orders. While each bagel order can have only one and only one bagel order line items. Bagel order line items may have many bagel orders. Similarly, bagels can have only one and only one bagel order line items, while a bagel order line item can have many bagels.

e. **Explanation of a and b:**

The database was normalized to third normal form by meeting all of the requirements of second normal form. Secondly, all transitive dependencies were removed from tables; which means looking at each table to see if more fields that aren't dependent on a

key can be split into other tables. Hence, a customer table was created with its own private key, and added a foreign key to the bagel order to connect the two tables.

In terms of cardinality from customer to bagel:

Each customer can have many bagel orders. While each bagel order can have only one and only one bagel order line items. Bagel order line items may have many bagel orders. Similarly, bagels can have only one and only one bagel order line items, while a bagel order line item can have many bagels.

(cont'd)

3. **Final Database Model:**

Nora's Bagel Bin Database Blueprints

Final Physical Database Model

a. **Names and cardinality transferred from 2NF table to 3NF table**
b. **b. Assign datatypes to each table**

BAGEL ORDER		
PK	Bagel_Order_ID	INT
FK	Customer_ID	INT
	Order_date	TIMESTAMP
	Delivery_Fee	DECIMAL (5,2)
	Special_Notes	VARCHAR(200)

1:M

BAGEL ORDER LINE ITEM		
PK / FK	Bagel_Order_ID	INT
PK / FK	Bagel_ID	INT
	Bagel_Quantity	INT

M:1

BAGEL		
PK	Bagel_ID	INT
	Bagel_Name	VARCHAR(30)
	Bagel_Description	VARCHAR(200)
	Bagel_Price	NUMERIC (5,2)

M:1

CUSTOMER		
PK	Customer_ID	INT
	First_Name	VARCHAR(30)
	Last_Name	VARCHAR(30)
	Address_1	VARCHAR(95)
	Address_2	VARCHAR(95)
	City	VARCHAR(35)
	State	CHAR(2)
	Zip	VARCHAR(5)
	Mobile_Phone	VARCHAR(20)

B. Create Jaunty Coffee Co. Database

Proof of Execution Screenshots

1. Develop SQL code to create *each* table as specified in the attached "Jaunty Coffee Co. ERD"

Embed PRO Collaborate

Query successfully executed in 80ms ×

Schema SQL

```sql
-- Create Tables

CREATE TABLE COFFEE_SHOP (
  `shop_id` INT AUTO_INCREMENT NOT NULL,
  `shop_name` VARCHAR(50),
  `city` VARCHAR(50),
  `state` CHAR(2),
  PRIMARY KEY (`shop_id`)
);

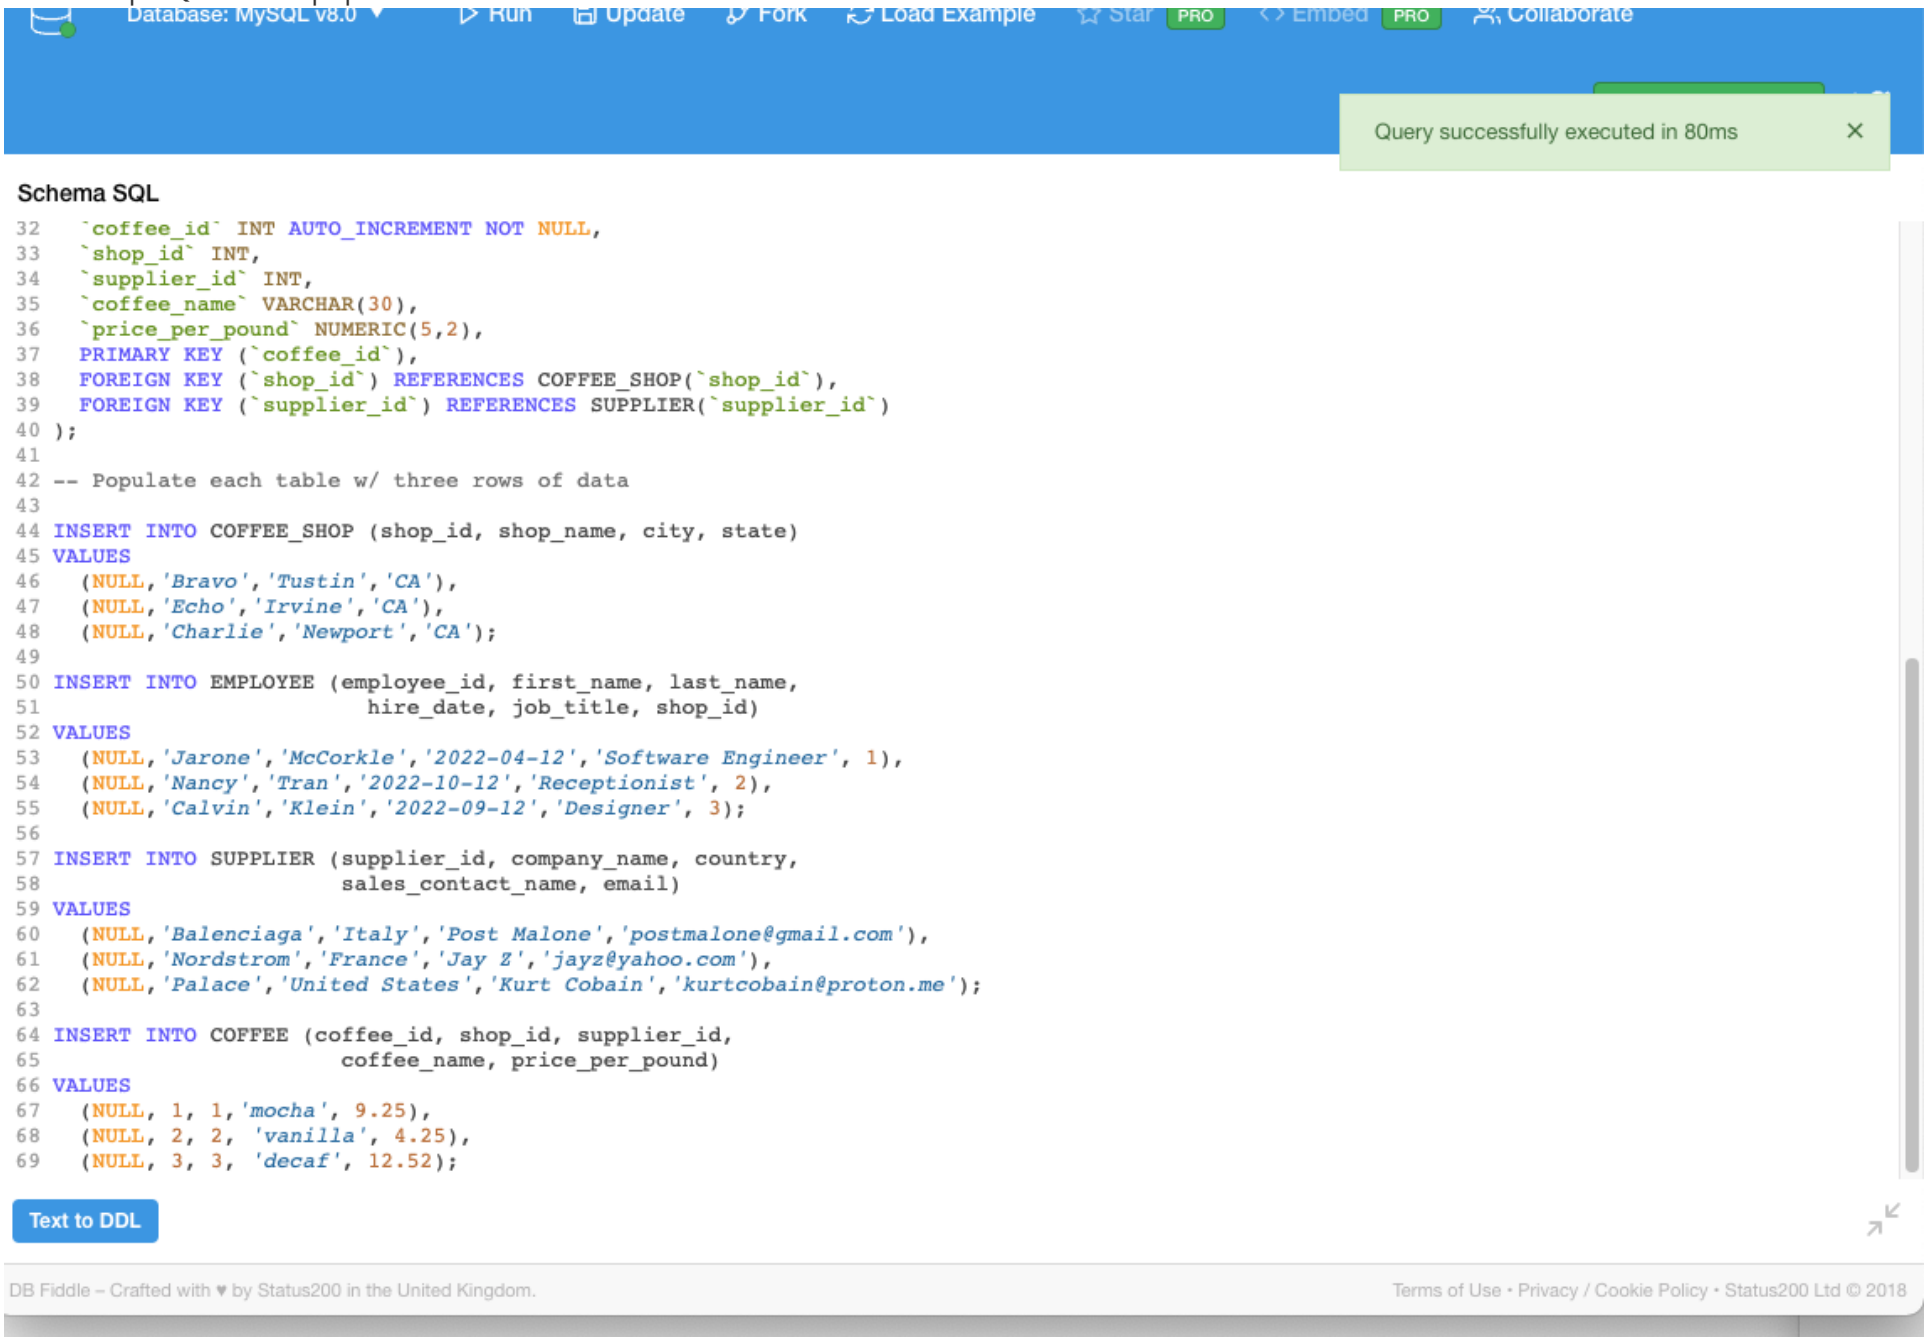
CREATE TABLE EMPLOYEE (
  `employee_id` INT AUTO_INCREMENT NOT NULL,
  `first_name` VARCHAR(30),
  `last_name` VARCHAR(30),
  `hire_date` DATE,
  `job_title` VARCHAR(30),
  `shop_id` INT,
  PRIMARY KEY (`employee_id`),
  FOREIGN KEY (`shop_id`) REFERENCES COFFEE_SHOP(`shop_id`)
);

CREATE TABLE SUPPLIER (
  `supplier_id` INT AUTO_INCREMENT NOT NULL,
  `company_name` VARCHAR(50),
  `country` VARCHAR(30),
  `sales_contact_name` VARCHAR(60),
  `email` VARCHAR(50),
  PRIMARY KEY (`supplier_id`)
);

CREATE TABLE COFFEE (
  `coffee_id` INT AUTO_INCREMENT NOT NULL,
  `shop_id` INT,
  `supplier_id` INT,
  `coffee_name` VARCHAR(30),
  `price_per_pound` NUMERIC(5,2),
  PRIMARY KEY (`coffee_id`),
```

Text to DDL

2. Develop SQL code to populate at least **three** rows of data in each table.



3. **Develop SQL code to create a view, concatenate employees first and last name**

Query successfully executed in 64ms

Schema SQL

```
  `supplier_id` INT,
  `coffee_name` VARCHAR(30),
  `price_per_pound` NUMERIC(5,2),
  PRIMARY KEY (`coffee_id`),
  FOREIGN KEY (`shop_id`) REFERENCES COFFEE_SHOP(`shop_id`),
  FOREIGN KEY (`supplier_id`) REFERENCES SUPPLIER(`supplier_id`)
);

-- Populate each table w/ three rows of data

INSERT INTO COFFEE_SHOP (shop_id, shop_name, city, state)
VALUES
  (NULL,'Bravo','Tustin','CA'),
  (NULL,'Echo','Irvine','CA'),
  (NULL,'Charlie','Newport','CA');

INSERT INTO EMPLOYEE (employee_id, first_name, last_name,
                      hire_date, job_title, shop_id)
VALUES
  (NULL,'Jarone','McCorkle','2022-04-12','Software Engineer', 1),
  (NULL,'Nancy','Tran','2022-10-12','Receptionist', 2),
  (NULL,'Calvin','Klein','2022-09-12','Designer', 3);

INSERT INTO SUPPLIER (supplier_id, company_name, country,
                      sales_contact_name, email)
VALUES
  (NULL,'Balenciaga','Italy','Post Malone','postmalone@gmail.com'),
  (NULL,'Nordstrom','France','Jay Z','jayz@yahoo.com'),
  (NULL,'Palace','United States','Kurt Cobain','kurtcobain@proton.me');

INSERT INTO COFFEE (coffee_id, shop_id, supplier_id,
                    coffee_name, price_per_pound)
VALUES
  (NULL, 1, 1,'mocha', 9.25),
  (NULL, 2, 2, 'vanilla', 4.25),
  (NULL, 3, 3, 'decaf', 12.52);

-- Create View
CREATE VIEW Employee_View AS SELECT
CONCAT(first_name, ' ' , last_name) AS employee_full_name,
first_name, last_name, hire_date, job_title, shop_id
FROM EMPLOYEE
```

Text to DDL

Schema SQL

```
  COFFEE_SHOP(`shop_id`),
39  FOREIGN KEY (`supplier_id`) REFERENCES
  SUPPLIER(`supplier_id`)
40 );
41
42 -- Populate each table w/ three rows of data
43
44 INSERT INTO COFFEE_SHOP (shop_id, shop_name, city, state)

4. **Develop SQL code to create an index on the coffee_name field from the Coffee table.**

Schema SQL

```
   Cobain','kurtcobain@proton.me');
63
64 INSERT INTO COFFEE (coffee_id, shop_id, supplier_id,
65                        coffee_name, price_per_pound)
66 VALUES
67   (NULL, 1, 1,'mocha', 9.25),
68   (NULL, 2, 2, 'vanilla', 4.25),
69   (NULL, 3, 3, 'decaf', 12.52);
70
71 -- Create View
72 CREATE VIEW Employee_View AS SELECT
73 CONCAT(first_name, ' ' , last_name) AS employee_full_name,
74 first_name, last_name, hire_date, job_title, shop_id
75 FROM EMPLOYEE;
76
77 -- Create Index
78 CREATE INDEX IDX_coffee_name
79 ON COFFEE (coffee_name);
```

Text to DDL

Query SQL

```
1 SHOW INDEX
2 FROM COFFEE;
```

Results

Query #1 Execution time: 13ms

Table	Non_unique	Key_name	Seq_in_index	Column_name	Collation	Cardinality	Sub_part	Null	Index_type	Comment
COFFEE	0	PRIMARY	1	coffee_id	A	3	null		BTREE	
COFFEE	1	shop_id	1	shop_id	A	3	null	YES	BTREE	
COFFEE	1	supplier_id	1	supplier_id	A	3	null	YES	BTREE	
COFFEE	1	IDX_coffee_name	1	coffee_name	A	3	null	YES	BTREE	

5. Develop SQL code to create an SFW (SELECT–FROM–WHERE) query for *any* of your tables or views

Schema SQL

```
);

INSERT INTO COFFEE_SHOP (shop_id, shop_name, city, state)
VALUES
  (NULL,'Bravo','Tustin','CA'),
  (NULL,'Echo','Irvine','CA'),
  (NULL,'Charlie','Newport','CA');

INSERT INTO EMPLOYEE (employee_id, first_name, last_name,
                      hire_date, job_title, shop_id)
VALUES
  (NULL,'Jarone','McCorkle','2022-04-12','Software Engineer', 1),
  (NULL,'Nancy','Tran','2022-10-12','Receptionist', 2),
  (NULL,'Calvin','Klein','2022-09-12','Designer', 3);

INSERT INTO SUPPLIER (supplier_id, company_name, country,
                      sales_contact_name, email)
VALUES
  (NULL,'Balenciaga','Italy','Post Malone','postmalone@gmail.com'),
```

Text to DDL

Query SQL

```
SELECT city
FROM COFFEE_SHOP
WHERE state = 'CA';
```

Results

Copy as Markdown

Query #1 Execution time: 0ms

city
Tustin
Irvine
Newport

6. Join **three** different tables and include attributes from *all* three tables in its output

Schema SQL

```sql
CREATE TABLE COFFEE_SHOP (
  `shop_id` INT AUTO_INCREMENT NOT NULL,
  `shop_name` VARCHAR(50),
  `city` VARCHAR(50),
  `state` CHAR(2),
  PRIMARY KEY (`shop_id`)
);

CREATE TABLE EMPLOYEE (
  `employee_id` INT AUTO_INCREMENT NOT NULL,
  `first_name` VARCHAR(30),
  `last_name` VARCHAR(30),
  `hire_date` DATE,
  `job_title` VARCHAR(30),
  `shop_id` INT,
  PRIMARY KEY (`employee_id`),
  FOREIGN KEY (`shop_id`) REFERENCES
```

Text to DDL

Query SQL

```sql
SELECT * FROM COFFEE_SHOP a
INNER JOIN EMPLOYEE d ON d.shop_id = a.shop_id
INNER JOIN COFFEE o ON o.shop_id = d.shop_id
INNER JOIN SUPPLIER c ON c.supplier_id = o.supplier_id;
```
